HARE can bind specifically to at least one of hyaluronic acid (HA, also known as hyaluronan), chondroitin (C) or chondroitin sulphate (CS). HA is an extracellular matrix component of all tissues, in particular cartilage, skin and vitreous humour. HARE is the endocytic receptor responsible for removing HA and other glycosaminoglycans from the circulation. The present sequence is the coding sequence for rat maps.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim

                                                                                                                                                                                                                                                                                                                               The present invention relates to sequences for rat and human HARE (Hyaluronic Acid Receptor for Endocytosis, ABA04648, ABA04652, AAM47675 and AAM47684). HARE can bind specifically to at least one of hyaluronic acid (HA, also known as hyaluronan), chondroitin (C) or chondroitin sulphate (CS). HA is an extracellular matrix component of all tissues, in particular cartilage, skin and vitreous humour. HARE is the endocytic receptor responsible for removing HA and other glycosaminoglycans from the circulation. The present sequence is the coding sequence for human maps.
                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 49;

                                                                                                                                                                     Cytostatic; contraceptive; and cheir country sequences. Line protectins have CC Cytostatic; contraceptive; and infilammatory; immunomodulatory; and CC diagnosis and treatment of diseases associated with inappropriate Novx CC expression. They may be used to treat disorders associated with decreased cexpression by rectifying mutations or deletions in a patient's genome CC that affect the activity of protein by expressing inactive proteins or to CC produce NoVx proteins, by inserting the nucleic acid into a cell and CC culturing it to express the production of protein They are used to CC assays to detect and quantitate the presence of similar DNAs in samples, CC and which patients may need restorative therapy. The NOVX protein may CC assays to detect and quantitate the production of antibodies (Abs) against CC NoVX and in assays to identify modulators of NOVX expression and CC activity. The anti-NOVX Abs and antagonist are used to down regulate CC expression and activity. The anti-NOVX Abs are used for detecting the CC expression and activity. The anti-NOVX Abs are used for detecting the CC characteristic of serine/threonine kinases, and are used to treat CC characteristic of serine/threonine kinases, and are used to treat CC characteristic of serine/threonine kinases, and are used to treat CC characteristic of serine/threonine kinases, and are used to treat CC the epidermal growth factor (EG) like Super family and are involved in, cell development, anontosis cell adhesion or courth.
